

The new BG-Sweetscent with improved emission profile

The new BG-Sweetscent comes as an envelope filled with the three attractive components in granular form.

For the same price as the old one, the new BG-Sweetscent offers the following improvements:

- **A more natural emission pattern** – the spatial distribution of the cocktail of attractive molecules is more equally mixed and resembles the natural emission of human skin odours.
- **Better protection against environmental influence** – the waterproof envelope allows a diffusion of the attractants through the membrane. At the same time the components are protected against rain, humidity and light.
- **Improved emission profile** – the attractants are formulated into specific polymers that provide a controlled release of the active ingredients.

Biogents
Mosquito Control

A more natural emission pattern

Old BG-Sweetscent with the components separated from each other.

New BG-Sweetscent with polymere particles that provide a more uniform mixture of the attractants.

Improved emission profile
